

GitHub & Lab Setup Guide

This guide walks you through creating a GitHub account, generating an access token, cloning your lab repository, and submitting your first commit. Follow each step in order — don't skip ahead!

Part 1: Create Your GitHub Account

1. Go to **github.com**.
 2. Click **Sign up** in the top-right corner.
 3. **Do NOT continue with Google or Apple** — use email/password signup instead.
 4. Enter your **email** and choose a password.
 5. For your **username**, use a lowercase **"u"** followed by your student number (example: u123456).
 6. Select **Turkey** as your country.
 7. Click **Create account**.
 8. Check your email for a verification code and enter it.
 9. Log in to the account you just created.
-

Part 2: Generate a Personal Access Token

1. Click your **profile picture** in the top-right corner, then click **Settings**.
 2. Scroll to the bottom of the left sidebar and click **Developer settings**.
 3. Click **Personal access tokens**, then click **Tokens (classic)**.
 4. Click **Generate new token**, and choose the **(classic)** option.
 5. In the **Note** field, type key.
 6. Under **Expiration**, select **Custom**, and use the button on the right to pick a date **one year from now**.
 7. Check **all the checkboxes** for scopes/permissions.
 8. Click **Generate token**.
 9. **Copy the generated token** — you'll need it in a moment. (You won't be able to see it again later, so don't lose it!)
-

Part 3: Save Your Token Somewhere You Can Access Later

1. Open a **new browser tab** and go to **dys.mu.edu.tr**.

2. Log in with your **student email and password**.
 3. Click the **message icon** in the top-right corner.
 4. Select **yourself** from the recipient list.
 5. **Paste the token** you copied earlier and send the message to yourself.
-

Part 4: Fork the Lab Repository

1. Go to this link: <https://github.com/u2042420803/dblab2026>
 2. Click the **Fork** button in the top-right corner.
 3. Click **Create a new fork**.
 4. Keep the repository name as **dblab2026**.
 5. Click **Create fork**.
-

Part 5: Clone the Repository to Your Computer

1. In your newly forked repo, click the green **Code** button (top-right).
2. Under the **HTTPS** tab, copy the command shown (there's a small copy icon next to it).
3. Open your **terminal**.
4. Type git clone followed by a space, then **right-click** to paste the URL you copied, and press **Enter**.
5. Once cloning finishes, run:

```
cd ceng1009_lab
```

6. Then move into the first week's folder:

```
cd week1
```

Part 6: Create and Edit Your First File

1. Open a new file in the terminal text editor:

```
nano hello.py
```

2. Inside the editor, type:

```
print("Hello World")
```

3. Save and exit:
 - Press **CTRL + O** (save), then **ENTER** to confirm.

- Press **CTRL + X** to exit the editor.
-

Part 7: Commit and Push Your Work

Run these commands one at a time, pressing **Enter** after each:

```
git add hello.py
git config --global user.email "your email"
git config --global user.name "your username"
git commit -m "first commit"
git push
```

When prompted:

- **Username:** enter the GitHub username you created earlier (e.g. u123456)
 - **Password:** paste the **token** you emailed yourself from dys.mu.edu.tr, then press **Enter**
-

 **That's it!** If everything worked, your hello.py file is now pushed to your GitHub repository.

 **Tip:** Keep that access token safe — treat it like a password. Don't share it with anyone or post it publicly.
